

# River Murray flooding and your electricity supply

**SA Power Networks is preparing for flooding along the River Murray which is expected to impact electricity supply to low-lying properties and infrastructure. There is a significant safety risk posed by electrical assets in floodwaters.**

We have been making urgent assessments around the potential impact on customers and infrastructure of floods up to anticipated daily flow levels of 175GL for the first peak and have followed SES modelling for any subsequent peaks.

We are currently assessing electricity infrastructure at risk, based on latest official flood predictions. Some of our infrastructure is already standing in floodwaters on floodplains beyond the banks of the river. Electricity supply will almost certainly be disconnected to some flooded areas as the flood surge moves down the river over coming weeks.

Disconnections may involve isolated shacks or multiple properties in low-lying areas. We will also monitor any impact on the higher voltage parts of our network that may be at risk.
